From Local Infoset to Global Infonet - the Extension of Team Syntegrity

Joe Truss and Chris Cullen
Team Syntegrity, Inc.
Toronto, Ontario, Canada

Using core principles underlying Team Syntegrity we will show how a coherent democratic planetary network could evolve. Syntegration provides requisite protocols for participation. Orthogonal sets and other features of the underlying icosahedral architecture provide the structural integrity to support geodesic extension from and initial set of thirty people to over seven billion in only twelve iterations. Application of these same principles to less ambitious initiatives, such as conferences, will also be presented.
